Installation guide

Auth Ticket : Direct Ticked Access to Moodle

Installing

This plugin installs using the standard install method for moodle plugins.

- Unzip the archive in the /auth directory of your moodle installation
- Browse to the *Administration > Notification* to finish logical installation

Enabling the plugin

Ticket based authentification needs being enabled in the *Administration > Plugins > Authentication > Manage authentication plugins* panel.

You should place this authentication at the highest possible priority for the pluginto catch any explicit "ticket" attribute in the incoming query.

Global settings

There are only three settings for this plugin:

Ticket TimeGuard

This is the delay starting from ticket emission date the ticket will be valid if it has been created as a short ticket.

Ticket Long Term TimeGuard

Same as above, but for the long tickets.

Use SSL

Tickets can be encrypted using either DES or RSA encryption. RSA uses the underlying openssl libraries. It is more compatible, but sometimes not available on non ssl enabled hosting. DES uses the mysql/mariadb AES_ENCRYPT/AES_DECRYPT function pair, but this is not available in other DB supports.
