

Additional parameters for hierarchical data

Dashboard block

Hierarchical display provides a more readable tree representation of the data when data adopts a tree architecture. A tree architecture is denoted when data provides a “parentable” structure of the records, i.e., provides an “id” field and a “parent” field referring to this id.

- Série de la liaison hiérarchique : Série hiérarchique.
- Série de l'arbre : Définit la liste de colonnes (aliases) qui produisent l'intitulé de nœud d'arbre.

Output formatting

As for all other value display, the values can be postformatted using a “sprintf” syntax.
