Dashboard Block

File Output Configuration

- **Generate output:** No / Yes
- **File output fields:** The file output can be fed with fields other than those used for display.
- **Data formatting:** These fields let you reformat the output data according to masks compatible with the “sprintf” function. For a list of reference fields, the format list must contain the same number of formatting expressions separated by semicolons. An empty expression means “no formatting”.

Learn more about formatted strings

- **Output file type:** CSV record / CSV record without header line / SQL INSERT statement
- **SQL table name (SQL output):** If you choose to output SQL statements, you must specify the target table name for the insertions.
- **File location (in moodledata):** Data can be generated from a scheduled refresh (deferred refresh). This setting determines the path within the course files where the file will be generated.

Warning: This path must exist in the course files. The generator will not create the directory if it does not exist.

- **Timestamp files:** If enabled, each generated file will be completed with a timestamp.
- **Special location:** Administrators may need to generate output files in paths that are not controlled by Moodle.
