PublishFlow Block

Deploying a course from a central catalogue

Description

In this configuration, the block is used to send a full copy of the course in which it appears to one of the platforms where it can be used for training. For this, the platform hosting this copy of the course must be configured (central settings) to serve as a “Catalogue” or possibly as a “Combined Factory/Catalogue”).

The course can be deployed on the platforms accessible to you and on which you are given the permission to deploy (for example because you have the right to create courses on the remote platform).

Use case

Teachers share courses in a “common” space to make reusable pedagogical scenarios available to colleagues. The teachers shared from their institution by placing a “Sharing” block (the same block, but in a different platform configuration), and sent a copy of the course to the common platform.

Colleagues from other institutions can access the course (according to an access method tied to a characteristic of their profile), view it, and find the course deployment block there. Teachers can in one click retrieve a copy of this deployed course on their institution's site and (subject to a specific integration) directly in their assigned category.

Procedure

Other use cases

The deployment block has a number of configuration possibilities allowing deployment to a freely chosen remote category. The publishing system must then be regularly synchronised to update its knowledge of the remote category tree.

Some people receive a special capability that will allow them to “deploy everywhere”
