

Manage questions

Magtest multitrack test

Each magtest manages a set of question that needs collecting a score for each output category when the user answers.

the question list allows managing questions.

Programming questions will depend on the answer mode.

If *singlechoice* option is off, the student is proposed an assertion for each output category. The student will have to choose “one of” the available assertions as an answer. The weight of the answer will be added to its corresponding category score, and none to the other categories.

If *singlechoice* option is on, the student only has to answer “yes” or “no” (or click the answer checkbox). when a question is marked for answer, the weights of each answer is added to their respective category score tracks. If the question is not marked, no score will be added to any category track.

Adding a question

Importing questions

You can import questions using a simple CSV file respecting the following format:

Question import format

Import file must be UTF8 encoded, separated with “;”, one question per line and have one first column for question text. Following example are given assuming 3 categories A, B, C have been defined.

If *singlechoice* options is on, next columns are weights (integer) for each category in category order.

Example:

```
this is a question 1;3;0;0
this is a second question 2;0;4;0
this is a third question 3;0;0;1
```

If *singlechoice* is off, next columns must feed in order : answer text, weight (1 if unweighted), and helptertext for each category in order.

Example:

```
this is a question 1;answer;1;helper for answer 1;answer2;4;helper for
answer 2;answer3;1;helper for answer 3
```
