

Manage questions

Magtest multitrack test

Each magtest manages a set of question that needs collecting a score for each output category when the user answers.

the question list allows managing questions.

Programming questions will depend on the answer mode.

If *singlechoice* option is off, the student is proposed an assertion for each output category. The student will have to choose "one of" the available assertions as an answer. The weight of the answer will be added to its corresponding category score, and none to the other categories.

If *singlechoice* option is on, the student only has to answer "yes" or "no" (or click the answer checkbox). when a question is marked for answer, the weights of each answer is added to their respective category score tracks. If the question is not marked, no score will be added to any category track.

Adding a question

Once categories are defined, you may add questions to the magtest:

The screenshot shows a web interface for adding a question. At the top, there is a blue header with the text "Add a question". Below this is a form with a label "Question Text" on the left. The main part of the form is a rich text editor with a toolbar containing icons for Paragraph, Bold (B), Italic (I), Bulleted list, Numbered list, Link, Unlink, Text color, Background color, Image, Video, Audio, and Help. Below the text area, there is a "Path:" field with the value "p".

Question just ask you for the question sentence. You will then asked for same amount of answers of categories.

If *singlechoice* option is off, you need input a text for the answer and an optional helper.

Answer 1

Category 'Cat 1' answer

Paragraph B I List Link Image Video File

Path: p

Weight

Helper Text

Paragraph B I List Link Image Video File

Path: p

In this case, the weight input may not be present if you didn't asked for weighting answers (the default). All scores are weighted to 1 by default.

If *singlechoice* option is on, you will just be asked for the weight (question score to add to category track), as no answer text is displayed for students.

Answer 1

Category 'Cat 1' answer the magtest is in singlechoice mode. You cannot write answer texts in this mode. the student will just answer "yes" or "no" to the question, and distribute weights in categories.

Weight

Importing questions

You can import questions using a simple CSV file respecting the following format:

Question import format

Import file must be UTF8 encoded, separated with “;”, one question per line and have one first column for question text. Following example are given assuming 3 categories A, B, C have been defined.

If *singlechoice* options is on, next columns are weights (integer) for each category in category order.

Example:

```
this is a question 1;3;0;0  
this is a second question 2;0;4;0  
this is a third question 3;0;0;1
```

If *singlechoice* is off, next columns must feed in order : answer text, weight (1 if unweighted), and helptext for each category in order.

Example:

```
this is a question 1;answer;1;helper for answer 1;answer2;4;helper for  
answer 2;answer3;1;helper for answer 3
```

The screenshot shows a user interface for importing a file. At the top left is a button labeled "Import file". Below it is a "Choose a file..." button. A large dashed rectangular box contains a blue downward-pointing arrow and the text "You can drag and drop files here to add them." Below this box is a "Clear all previous data" button and a checkbox labeled "Clearing all data will also clear all user results". At the bottom, there are two buttons: "Save changes" and "Cancel".

Just drop the file into the file manager and click on *Save changes*. Checking the *Remove all previous data* will clear all the magtest before importing a file. If it is NOT checked, the new questions will simply be appended to the existing one. Note that if students have already passed the test, they will NOT have any score for those new questions and their result may be erroneous.

Deleting a question
