# Playlist XML File format

## MPlayer module

The playlist XML file concentrates all information necessary to drive a multiple clips video show. You may also read the reference document here: http://code.google.com/p/moodle-flv-player/wiki/UsingXMLPlaylists.

The XML playlist document structure starts with a root element "trackList" which holds single "track" descriptors.

A track describes a full clip with following information:

- *location*: the url of the media
- *thumb*: an url to a thumbnails image for playlist graphical representation
- *title*: Clip's caption in the playlist
- *caption*: Id. title.

**Note :** XML Playlists are suitable for content publishers that have an industry level management of their content assets and are more likely to manage publications through textual metadata descriptors.
