MediaPlayer Module: Playlist File Format

XML Playlist

The Playlist file is an XML file providing a large amount of condensed information on the clips to play in the MediaPlayer. You can find more information on playlist technologies at the URL:

http://code.google.com/p/moodle-flv-player/wiki/UsingXMLPlaylists

The playlist file is built from a root element “trackList” that contains `track` descriptors.

A clip descriptor (track) provides a certain amount of information on the clip:

- **location:** The media url
- **thumb:** The url of the thumbnail associated with the clip
- **title:** The title of the clip in the playlist
- **caption:** Synonym of title (Title)

Note: This feature is provided as a utility for operators who already have a media heritage built in a private media library, and who are more likely to configure publications by producing text descriptors than by moving the original resources.
