Installation Guide

PDCertificate Module

Prerequisites

The PDCertificate is a rich and complex module that needs an activation key to develop its full power.

You will need twao major dependancies that are common to all APL plugins:

- local_aplcore : A core API plugin for all APL plugins, that offers the APL Licence Management bridge
- local_aplpdf : Providing enhanced PDF Libraries, used to

Installation

This module installs in the standard way:

1. Unzip the archive in the '/mod' directory of your Moodle installation.
2. Navigate to site administration notifications to logically install the component.

Central configuration

Group propagation (default)

If this option is activated, then the propagation of the entries in the following courses of the issue of a certificate retains the class group scheme to which the user belongs in the course that contains the certificate.

Any missing group in the next course (based on the name) will be created identically in the finish price.

Migration of certificates (community version) to training certificates

Migration tooling is provided for the transformation of old instances of the Certificate module. However, this tooling only concerns a few versions of this module.

Contact us for a specific history recovery project.
