ETL Report (Data extraction): Installation guide

Installation

This plugin is installed in the standard way in Moodle:

- Unzip the archive and copy the code into the `/report` directory of your installation
- Navigate to `Administration > Notifications` to complete the logical installation of the plugin

Global settings

Most settings are managed at the level of the extraction sub-plugin instances.

At global level only one setting is currently configurable:

Maximum number of records per run

It sets a limit on the maximum number of records that can be compiled in a single invocation of the extraction service. The purpose of this setting is to be able to reasonably split the extraction load when connecting a data client to an already heavily populated Moodle. By limiting the size of an incremental extraction run, it is possible to manage the impact of “continuous” extraction during this “catch-up on existing data” phase.

By default, the size is set to 5000 records.

Note: The number of records can be slightly above the limit. The incremental computation, based on date indications, will send all records known at the date of the last record, so as not to lose data on the next run.
